

INNOVATION IN COMPOSITE MANUFACTURE

SHORTLISTED: Taziker

Taziker's innovation is the FRP Legacy Footbridge. This is a cost-effective, maintenance-free, FRP footbridge solution that can be quickly and efficiently installed in remote or difficult to access areas.

Taziker has achieved this by bringing together proven innovative technologies, thereby providing a new market for the production and installation of safe access across the railway to replace existing dangerous level-crossings. The design incorporates all aspects, from foundations to construction, plus future maintenance.

The company has developed a design that allows a new footbridge to be constructed on a green-field site for a fraction of the current cost. Additionally, due to the compact design, the footbridge can also fit onto existing foundations, as well as bringing space-saving benefits when limited land is available.

The Legacy Footbridge has been designed with a traditional aesthetic to fit within rural locations or at historic stations - keeping the local environment in mind.
